

Optimize fluid transfer. End contamination.

DORS assists in finding and executing the most optimal routing in the process. By automating the process, DORS prevents incorrect routing and avoids interferences between ongoing operations which may lead to costly contamination. The auto routing feature constantly monitors the state of the plant and responds adaptively to changing

conditions. This helps to maximize uptime by identifying operational errors caused by faults and automatically re-routing without disrupting other operations. The system is smart, has an intuitive interface, and is easy to monitor.

Key Features

- Automatic line-up
- Automatic Transfer
- Automatic Circulation
- Animated piping lines
- Create “favorite” routes
- Preview fluid routing path
- Integrates with other systems
- Simultaneous operation

Benefits

- Eliminate the risk of pumping over board
- Reduce the risk of contamination
- Reduce risk of operational error
- Reduce chemical/mud losses
- Maximize uptime
- Enable efficient plant usage/capacity
